

- Pink color indicates parametrically generated polygonal shapes. The polygons can be hand-drawn or produced by a Python script from the attributes provided on the schematic (e.g. the width and length of the microstrip line).
- Blue points are the anchors - they connect the shapes to each other and to other graphical features (tracks, pads, vias)
- Anchors can be declared as not equipotential for the DRC. For example, the ends of the microstrip line should not be considered by DRC as shorted even though they are connected by a continuous copper area.
